

Abstract of the Disclosure

A time difference between a broadcast time included in a digital broadcast signal and a device time peculiar to an information processing device is calculated, and an estimated broadcast time is calculated according to the time difference and the device time. Therefore, the estimated broadcast time is calculated without adjusting the device time to the broadcast time. Accordingly, when the device requests a broadcast time, an operation based on the estimated broadcast time can be performed without exerting an influence of the broadcast time on constitutional elements or having a redundant configuration of a clock system.
